Review of Armillaria species in North America

Armillaria can be divided into 3 classifications

"Bad" *Armillaria* NABS I and NABS VI primary pathogens

"Good" *Armillaria* primary saprophytes NABS III, V, VII, X, and XI

Unknown NABS II and NABS IX pathogenicity

(NABS = North American Biological Species)

Armillaria species found on Nutrition Co-op plots throughout the Inland Northwestern United States.

"Bad" Armillaria - primary pathogen NABS I – Armillaria ostoyae

- Common
- Known as a highly virulent pathogen of conifers
- Causes tree mortality
- Causes tree <u>growth loss</u> (often with no apparent visible symptoms)

Armillaria species found on nutrition co-op plots throughout the Inland Northwestern United States.

"Good" *Armillaria* – primary saprophytes NABS III – *Armillaria calvescens* NABS V – *Armillaria sinapina* NABS VII – *Armillaria gallica*

- Closely related species
- Common
- Low pathogenicity; 5-10% found as bark fans
- Most individuals show no sign of pathogenicity and may be <u>beneficial for tree growth and or protection</u>.
- Difficult to identify

"Good" *Armillaria* – primary saprophyte NABS X – currently unnamed

Common

- Low pathogenicity; 5-10% found as bark fans
- Low level pathogenicity of NABS X may be attributed to NABS X x NABS III,V,VII hybrids
- Most individuals show no sign of pathogenicity and may be <u>beneficial for tree growth and or protection</u>.

Rhizomorph collection type

Robert L. Anderson, USDA Forest Service forestryimages.com

All species of *Armillaria* form rhizomorphs.

Most rhizomorphs are found on the surface of a root, some grow freely through the soil, and others can be found under the bark of a highly infected tree.

Presence of rhizomorphs does not necessarily indicate pathogenicity of an *Armillaria* individual.

Bark fan collection type

Missoula Archive, USDA Forest Service forestryimages.com

Bark fans from live trees indicate high pathogenicity of an *Armillaria* individual.

Dead trees with bark fans do not necessarily indicate a pathogenic *Armillaria* individual.

Wood collection type

Robert L. Anderson, USDA Forest Service forestryimages.com

Wood samples are usually taken from trees that have recently been killed or are infected with a pathogenic *Armillaria* individual.

Often dark lines known as zone lines can be seen in infected wood.

Types of information collected from Nutrition Co-op sites

- Isolate ID
- Location
- Host Species
- Collection Type (Bark Fan, Rhizomorph, or Wood)
- Host Status (Dead or Alive)
- Habitat Type
- Fertilization Treatment
- Species ID
- Rock Type

Stanton Armillaria Genet Distribution

- NABS X may have important interactions with *A. ostoyae* on specific sites that may be beneficial to tree health.
- What factors may have contributed to the evolution of NABS X and what management practices can maintain NABS X on sites threatened by *A. ostoyae* ?

Factors that may benefit NABS X

- Ash caps NABS X may be adapted to survive in ash cap rich environments.
- Fire NABS X is thought to occur deeper in the soil than other *Armillaria* species and this may enable it to better withstand fire events. Fire may also provide nutrients to the soil that NABS X prefers.
- White pine NABS X is commonly found where there is white pine and may be especially adapted to white pine ecosystems.

NABS X

Historic White Pine Range

Management practices that may help maintain NABS X

Prescribed burning

• Planting white pine

• Fertilization (?)

These regions of rDNA repeat many times

We amplify all the repeats of the IGS-1 region for a given isolate, then we obtain an IGS-1 region sequence

Phylogenetic tree showing genetic diversity of Armillaria ostoyae

Management Practices

Each species, hybrid, or grouping of *Armillaria* may occupy different preferred habitat type ranges.

Habitat Type is based on

Moisture Light Temperature Soil Characteristics Rock Types *Armillaria* is a primary driver of forest ecosystems in the Inland Northwest.

Not all *Armillaria* species are the same and not all individuals from the same species are the same.

Management decisions on sites where *Armillaria* is a problem are likely to be site specific and should include the consideration of which *Armillaria* species are present as well as habitat, soil, and rock type conditions.
